Program: Orthopedic Surgery
Type: Original Research

Background: The aim of this study is to investigate the impact of improved sleep quality and extension can have on academic performance in medical students. Additional outcome measures include evaluating mood (Profile of Mood States) and sleepiness (Epworth Sleepiness Scale). Our hypothesis is that improved sleep quality and extension will significantly improve test scores, mood and daytime sleepiness.

Methods: This is a pilot study involving 20 first-year medical students. They will be randomized into either control or intervention groups. Both groups will be monitored for baseline sleep characteristics. The intervention group will then undergo a training program aimed to improve sleep quality and extension. Subjects will be monitored via actigraphy devices (Actigraph wGT3x-BT) on the dominant hand at all times as well as daily, subjective sleep logs. The primary outcome will be raw test scores at the typical testing intervals based on the curriculum. ESS questionnaire will be administered at the beginning and end of the study, and the POMS will be administered weekly.

Results and Conclusion: Pending

Program: Anesthesiology
Type: Original Research

Background: Vertebroplasty and kyphoplasty are two forms of percutaneous vertebal augmentation (PVA), in which polymethylmethacrylate cement is used to stabilize vertebral compression fractures (VCF). This study sought to evaluate the relationship between cement volume and clinical outcomes, including pain reduction, opioid use, and complication rate.

Methods: Retrospective chart review produced 88 patients who received PVA at a tertiary care outpatient pain clinic. Cement volume, type of PVA, gender, level, (thoracic vs lumbar) were collected, as well as clinical outcomes of numeric pain score (NPS), opioid percent change (OPC), and complications. Both pre-procedure and post-procedure (between 2-4 weeks) data were collected.

Results: Sixty-four patients (72.7%) had statistically significant NPS reduction of ≥50% pain (p<.001). The mean NPS reduction was 4.45 (p<.0001). Also sixty-three out of seventy-two patients who previously used opioids demonstrated some form of opioid reduction which was significant (p<.0001). The mean opioid reduction measured across all baseline opioid users was 48%. No statistically significant differences in NPS or OPC were seen across gender or level type. Linear regression using pre NPS as a covariate showed cement volume did not have a significant effect on NPS change or opioid reduction (p=.173 and p=.299 respectively). Cement leakage occurred as a complication in 10.2% of the patients, although only one complication was symptomatic.

Conclusion: Cement volume does not correlate with clinical outcomes of NPS reduction or OPC. Furthermore, our study reinforced PVA as a beneficial treatment for reducing pain and opioid consumption in patients with painful VCF.

Type: Review/Meta-analysis

Background: Pulmonary embolism (PE) is the third leading cause of acute cardiovascular disease, contributes to 250,000 American hospitalizations yearly. CT pulmonary angiography (CTPA) is the first-line imaging choice for suspected PE, however radiation exposure remains a concern. We compared the Dose-Length Product (DLP) in CTPA performed using adaptive statistical iterative reconstruction – V (ASIR-V) versus older filtered back projection (FBP) technique, while also evaluating the ability of ASIR-V to maintain diagnostic accuracy.

Methods: A retrospective review was performed of all CTPA scans completed for suspected PE during a one-year period at our institution. A total of 1095 studies met criteria for inclusion. Five-hundred and thirty-three (48.7%) of these were performed on a CT scanner utilizing ASIR-V (GE Healthcare), and 562 (51.3%) were performed on an older CT scanner utilizing standard FBP (Lightspeed VCT, GE Healthcare). Dose-length product (DLP) and demographic data were recorded. Original radiology reports from board-certified radiologists for each exam were reviewed. Diagnostic quality was determined by usage of specified
