

Supplemental Figure Legend

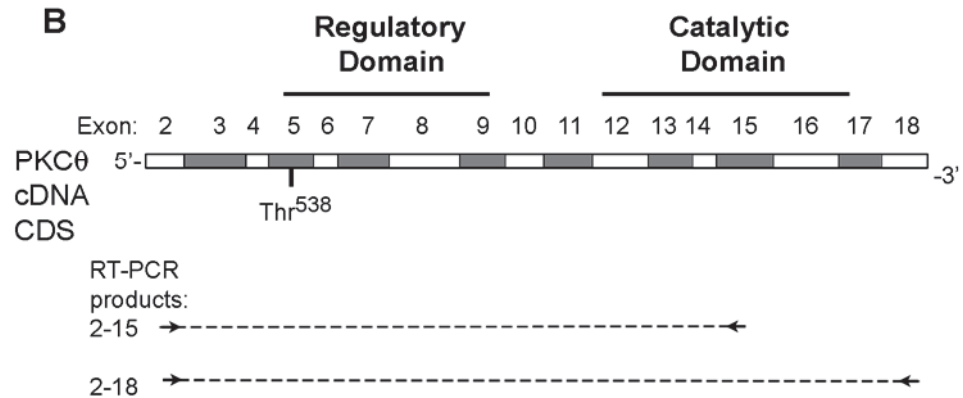

PKC θ protein and mRNA expressed in Huh-7 compared to Jurkat cells. **A.** Immunoblot for total PKC θ protein using whole cell extract from Jurkat or Huh-7 cells demonstrated a faster migrating polypeptide expressed in Huh-7 cells. **B.** Schematic diagram of the coding sequence (CDS) of PKC θ mRNA, indicating exons 2-18. The regulatory domain contains Thr⁵³⁸ and phosphorylation at this residue induces an activating conformational change. Antisera to total and phospho- Thr⁵³⁸ PKC θ detects this faster migrating polypeptide in Huh-7 cells (see Figures 6 and 7, in addition to Supplemental Figure 1A). Amplicons generated by long-distance PCR using primers in exons 2-15 or 2-18 are indicated with a dashed line. **C.** Long distance RT-PCR performed on total RNA from Huh-7 cells or Jurkat cells was electrophoretically separated on a 1% agarose gel and visualized by staining with ethidium bromide. The captured image was inverted to show dark bands on a lighter background for clarity.
