

The Journal of Neuroscience

November 2, 2005 • Volume 25 Number 44 www.jneurosci.org

Cover picture: Examples of whole objects: face-like objects (FOs, left) and their corresponding non-face-like objects (NFOs, right) composed of the same set of parts. Over 60,000 unique FOs/NFOs were constructed by combining a variety of facial feature-like parts. The inferior temporal neurons revealed spike correlation that depended on the feature configuration within a unique whole object. The configuration-dependent spike correlation emerged within 300 ms after stimulus onset, which is rapid enough to mediate recognition of the stimulus. For details, see the article by Hirabayashi and Miyashita in this issue (pages 10299–10307).

Andy Y. Shih, Ping Li, and Timothy H. Murphy

Correction: In the article "Kinetics of Exocytosis Is Faster in Cones Than in Rods," by Katalin Rabl, Lucia Cadetti, and Wallace B. Thoreson, which appeared on pages 4633–4640 of the May 4, 2005 issue, the concentration of EGTA given in the fourth paragraph of Materials and Methods is incorrect. The correct concentration is 5 mM.

Persons interested in becoming members of the Society for Neuroscience should contact the Membership Department, Society for Neuroscience, 11 Dupont Circle, NW, Suite 500, Washington, DC 20036, phone 202-462-6688.

Instructions for Authors are available at <http://www.jneurosci.org/misc/itoa.shtml>. Authors should refer to these Instructions online for recent changes that are made periodically.

Brief Communications Instructions for Authors are available via Internet (<http://www.sfn.org/content/Publications/TheJournalofNeuroscience/BriefComm/ifa.html>).

Submissions should be submitted online using the following url: <http://sfn.manuscriptcentral.com>. Please contact the Central Office, via phone, fax, or e-mail with any questions. Our contact information is as follows: phone, 202-462-6688; fax, 202-462-1547; e-mail, jn@sfn.org.
